**Question** What is the primary purpose of jQuery in web development? jQuery is a fast, small, and feature-rich JavaScript library that simplifies HTML document traversal, event handling, animation, and Ajax interactions, making it easier to develop cross-browser compatible web applications. How can you select multiple elements using jQuery? You can select multiple elements by separating their selectors with commas inside the jQuery selector, e.g., `$(div, p, span)`, which targets all `div`, `p`, and `span` elements simultaneously. What is the difference between `.each()` and `.map()` methods in jQuery? The `.each()` method iterates over a set of elements, executing a function for each element, typically used for side effects. The `.map()` method also iterates but transforms each element into a new value, returning a new jQuery object containing these transformed elements. How do you handle multiple checkbox selections using jQuery? You can select all checked checkboxes with a common class or attribute, e.g., `$(input[type=checkbox]:checked)`, and then iterate over them or retrieve their values as needed. What is the use of the jQuery `.multiple()` method? Actually, jQuery does not have a built-in method called `.multiple()`. However, handling multiple selections or operations on multiple elements is achieved through selectors combined with methods like `.each()`, `.map()`, or event delegation, depending on the requirement.
